

# Key-Value Data Store.

---

## Documentation Index:

1. Project Overview
2. Requirements Analysis
3. Feature list

## Proposed System

4. Use Case
  - 4.1 Use Case Diagram
  - 4.2 List of use case
  - 4.3 Fully dressed use case
5. Class Diagram
6. Sequence diagram
7. Features and utilities
8. Conclusion

- Project Completion Status

Design	Yes
Use case diagram	Yes
Class Diagram	Yes
Sequence Diagram	Yes

Read Operation	Yes
Write Operation	Yes
Delete Operation	Yes

## 1. Project Overview:

A file based key value data-store, that is used for storing file-based JSON Objects with keys(Strings).The library should be able to store the key value pairs at a specified location in the laptop or at default location.

## **Requirement Analysis:**

- **User Requirements Analysis:**
  - The proposed system should be able to store JSON Objects(file-based) with keys as **Key-Value Pairs**
  - The system should be able to support the basic **CRD(Create, Read and Delete)** operations.
  - The key value should not exceed **32 chars**.
  - The JSON Object should be capped at **16KB**.
  - **The proposed system should be exposed as a library to the client.**

## **2. Libraries and dependencies used:**

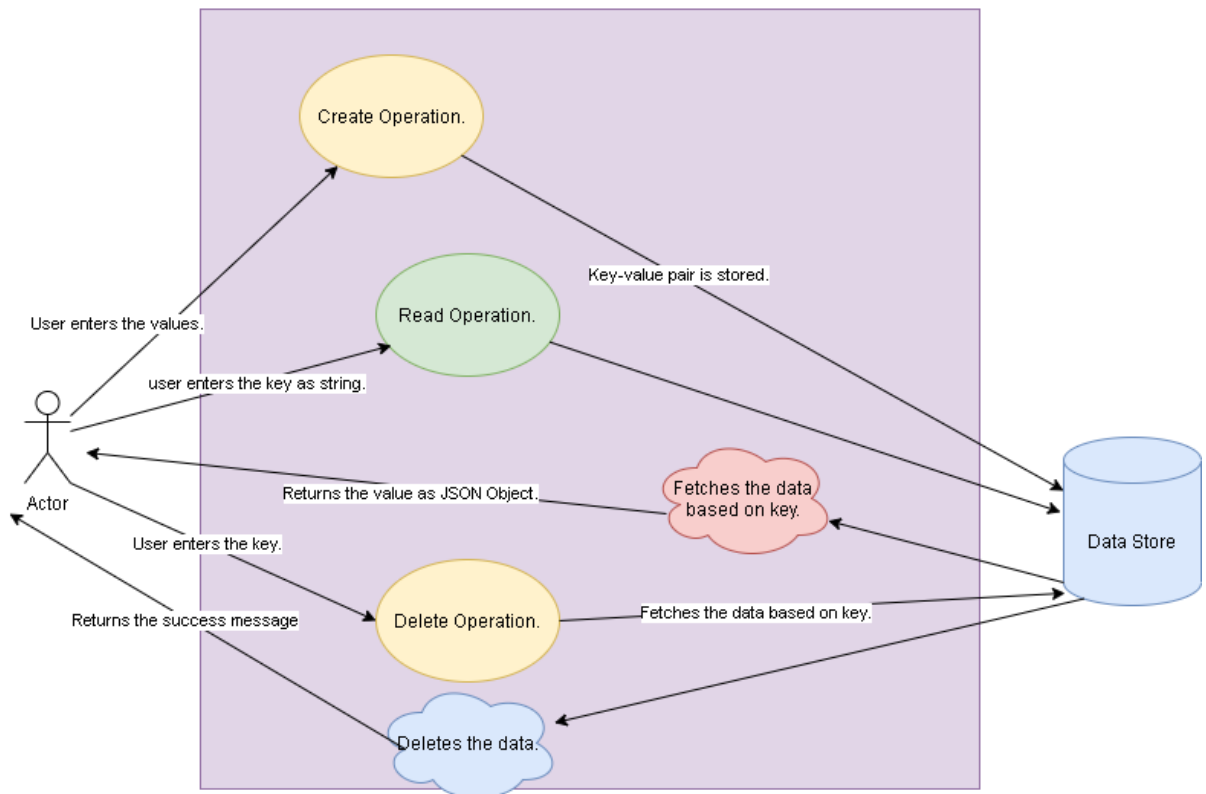

- **JAVA:** The key-value data store is entirely created using the java programming language. JSON-simple-data JAR and Jackson-data-bind JAR are used in order to work with JSON Objects.

## **3. Features :**

1. Create Operation
2. Read Operation
3. Delete Operation

## **4. Use Case Diagram:**

## File based Key-Value data store

### 4.2 Fully Dressed Use Case:

- **Create Operation:**

Use Case Headings	Explanation
<b>Name</b>	Create operation
<b>Scope</b>	Storing key-value pairs in file
<b>Pre-Conditions</b>	The key should be a string and value should be a JSON Object
<b>Success Guarantee</b>	The data is stored as key-value pair in file in specified location
<b>Frequency of occurrence</b>	Quite often occurring use case(High-priority)

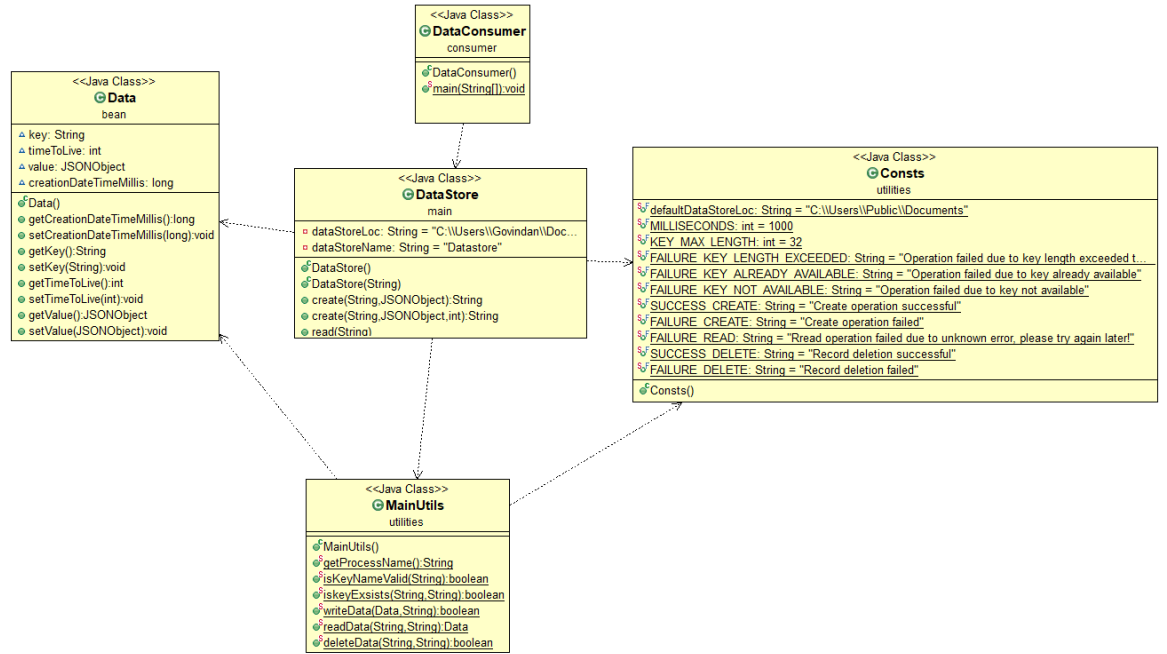

- **Read Operation:**

Use Case Headings	Explanation
<b>Name</b>	Read Operation
<b>Scope</b>	Returning the value associated with the given key.
<b>Pre-Conditions</b>	The given key should exist.
<b>Success Guarantee</b>	The JSON Object should be returned.
<b>Frequency of occurrence</b>	Quite often occurring use case(High-priority)

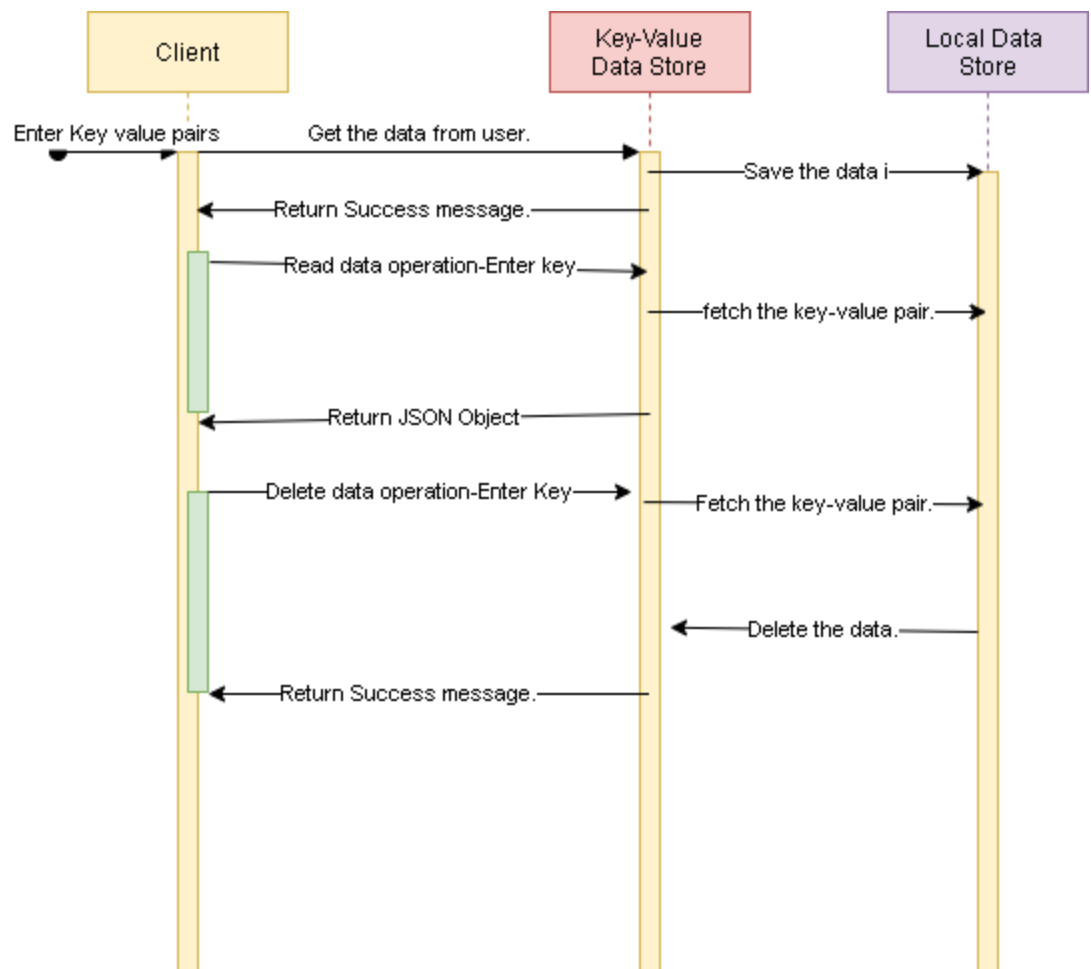

- **Delete Operation:**

Use Case Headings	Explanation
<b>Name</b>	Delete Operation
<b>Scope</b>	The key-value pair associated with the given key is deleted.
<b>Pre-Conditions</b>	The given key should exist.
<b>Success Guarantee</b>	The data is deleted.
<b>Frequency of occurrence</b>	Moderate(Medium-priority)

## **5.Class Diagram :**

## 6. Sequence Diagram:

## 7.Features and utilities:

- The library provides a file-based key-value data store to perform basic CRD operations on a file based system.
- **HashMap** data structure is used for storing key-value pairs and look up and hence the data access is efficient.
- No query language is required to perform operations.
- Appropriate error messages are returned, to keep track of the operations.

## **8.Conclusion:**

Thus, a file based key-value store library(system) that supports basic CRD(Create, Read and Delete) operations is created using Java. The key-value store system are scalable, flexible and are highly consistent in handling read/write operations in file.

**Done By:**

**Aditya Sairam**
